DECISION WORKSHEET

Can this change safely connect to the live campus?

Use this worksheet to structure discovery and review. It is illustrative, not a claim about Serverfarm's current controls, standards or performance.

Interlock	Question	Evidence / owner	State
Authority	Who has technical, life-safety, operational and customer authority? What triggers stop or escalation?	Decision owner, approvers, stop-work boundary, escalation path	Open / bounded / closed
Plant condition	What is the current redundancy, alarm, maintenance and dependency state?	Current system evidence, active risks, affected dependencies	Open / bounded / closed
Procedure	Does the method define scope, contingency, stop conditions, evidence and closure?	Approved MOP/EOP or equivalent, review record, rollback/contingency	Open / bounded / closed
Partner	Are internal and vendor owners, competence, parts, timing and accountability ready?	Named owner, vendor readiness, resource confirmation, contract/SLA context	Open / bounded / closed
Customer	Is continuity protected and communication proportionate to the risk?	Impact assessment, customer plan, SLA implications, escalation owner	Open / bounded / closed

Decision

- ☐ Proceed with controls
- ☐ Bound and replan
- ☐ Escalate with options
- ☐ Hold / stop

Decision record

Owner:

Evidence that changed the decision:

Next review / closure:

Customer communication:

Rule: pressure, schedule or prior success cannot substitute for current evidence and authority.

AFTER ACTION

Close the work. Keep the learning.

Closure question	Evidence	Portfolio decision
Did execution match the bounded plan?	actual sequence, deviations, alarms, observations	retain / revise procedure
Did any interlock change state during work?	trigger, decision, authority and response	update escalation threshold
Was customer communication timely and useful?	timestamps, message quality, response, escalation	retain / improve communication pattern
Did vendor or internal ownership hold?	commitment vs actual, response quality, closure	coach / contract / source decision
What recurrence or hidden dependency appeared?	root-cause evidence, linked work, trend history	local correction / portfolio learning
What should become standard work?	proof that the mechanism improved reliability or decision quality	protect / bound / adapt / do not reuse

Balanced evidence review

People Safety, workload, qualification, authority confidence and learning.	Plant Availability, recurrence, work aging, redundancy and asset condition.
Customer Continuity, communication, escalation and commitment trust.	Economics Vendor performance, OPEX/CAPEX implications, rework and lifecycle value.

AI-assisted, human-owned: synthesis may help find patterns across alarms, work orders and records. Technical, safety and customer decisions remain accountable to people with the relevant authority.
